

Inflammatory Bowel Disease

A selected overview

Dr Richard Gearry

Senior Lecturer, Department of Medicine, UOC

Consultant Gastroenterologist, Christchurch Hospital

Medical Director, Digestive Health Services Ltd

Medical Advisor, Christchurch Crohn's and Colitis Support Group

Who am I?

- Gastroenterologist with a passion for IBD
- Born and bred in Christchurch
- House Surgeon Nelson / Christchurch
- Gastroenterology Registrar, Christchurch
- PhD “Aspects of IBD in Canterbury”
- IBD Fellow, Box Hill Hospital, Melbourne
- IBD Researcher, Christchurch
- Nutrition Support Fellowship, St Mark’s, London

Acknowledgements

- Brian Poole
- Pharmaco / Ferring
 - Distributers of Pentasa

Conflicts of Interest

- I have received support to present research at international meetings from
 - Ferring/Pharmaco
 - Pharmatel Fresenius Kabi
 - Schering Plough
 - Abbott
 - Orphan

IBD – a selected overview

- What does the future hold?

Inflammatory Bowel Disease

The Gastrointestinal Tract

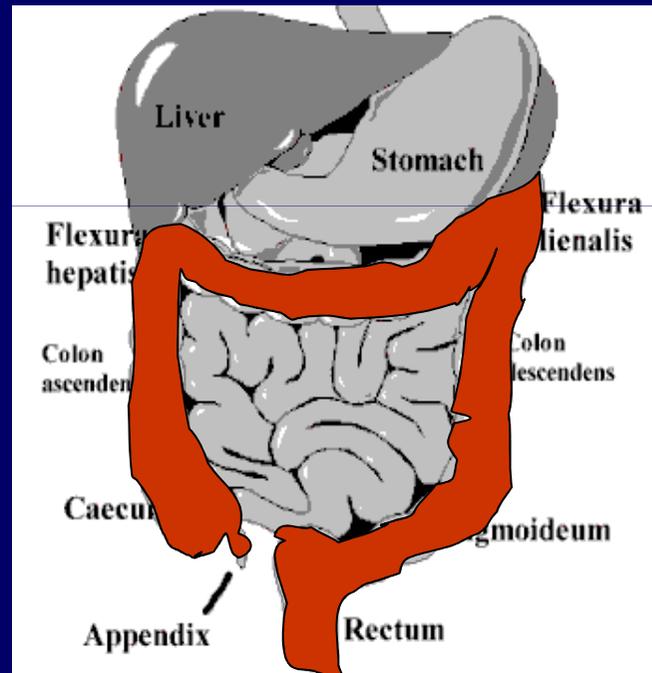

Crohn's disease

Any part of the GI tract

Patchy inflammation

Inflammation affects full thickness of intestine

Perianal disease

Ulcerative Colitis

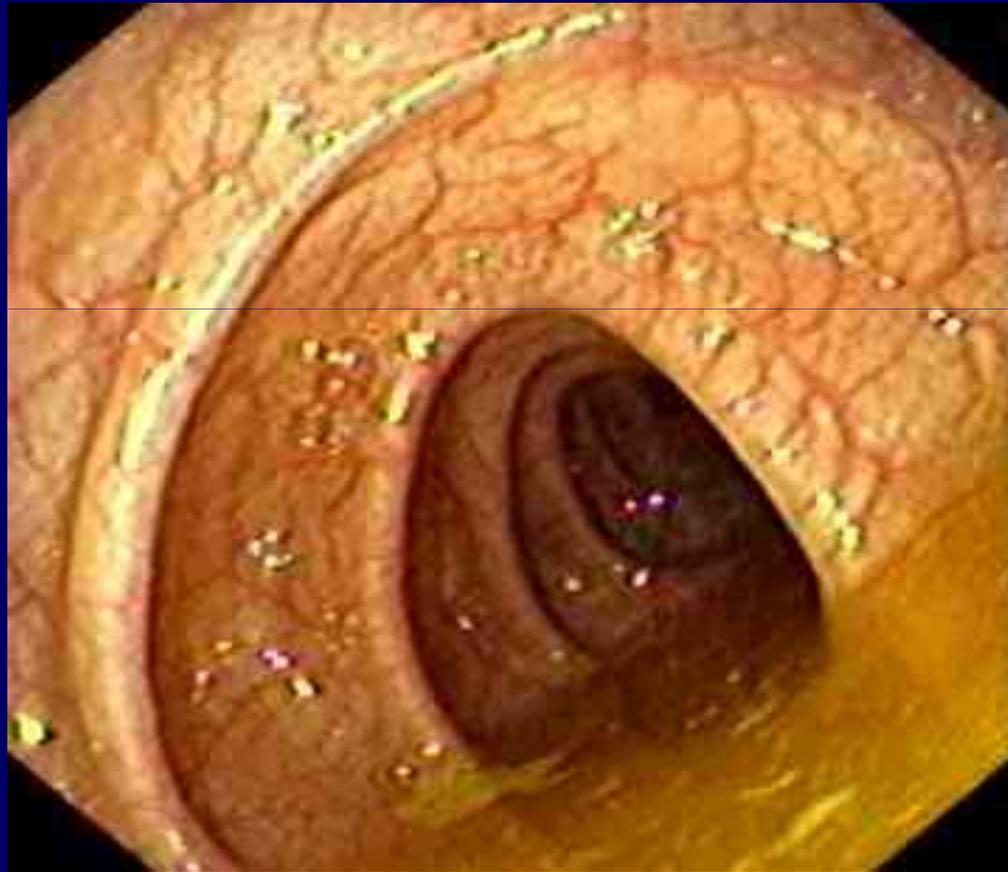

Colon only

Continuous inflammation

Inflammation starts at the bottom and moves proximally

Inflammation affects inner lining of bowel only (mucosa)

Normal Colon

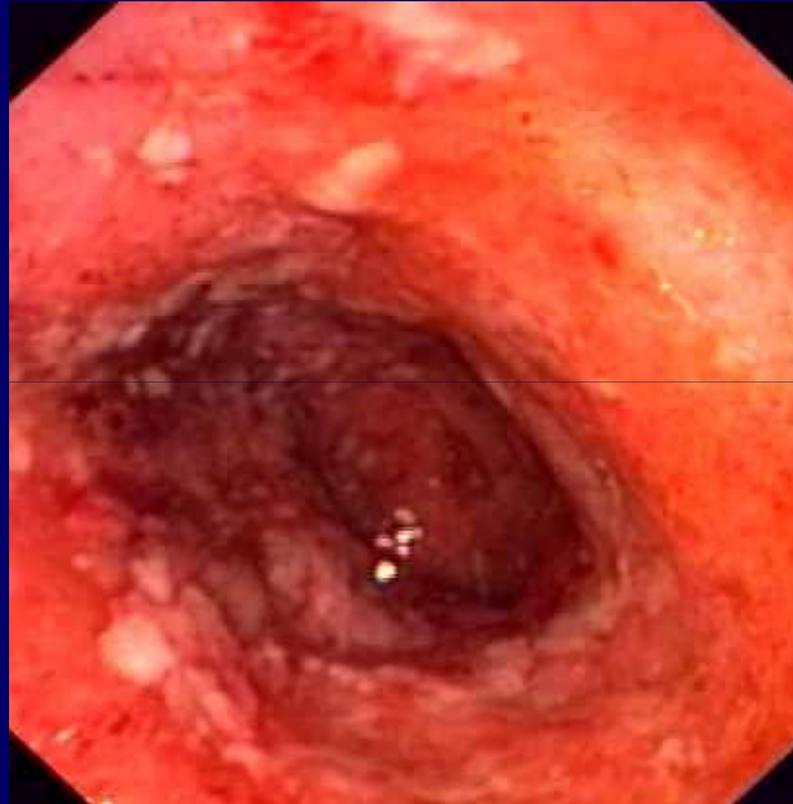

Inflammatory Bowel Disease

Abdominal
Pain

Diarrhoea

Rectal
Bleeding

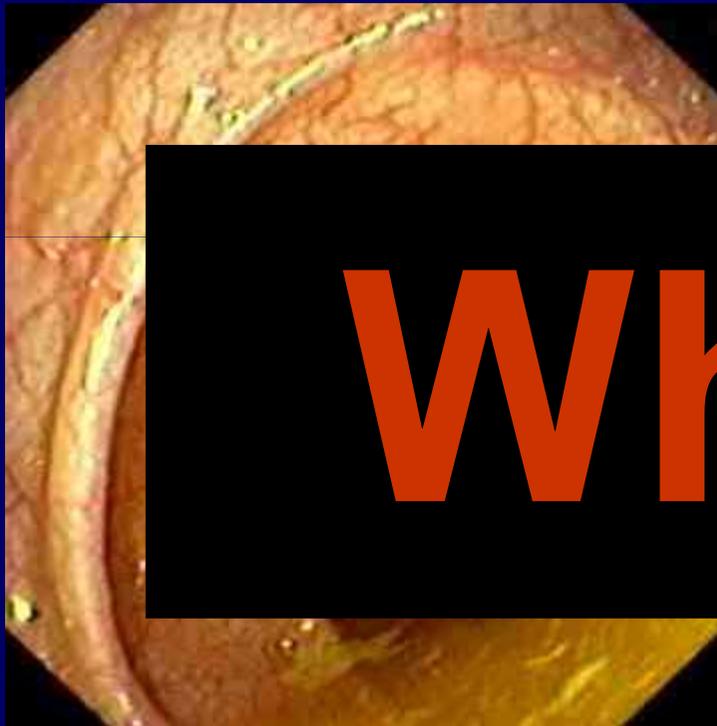

Weight Loss

Otago
1986

UC is about as common as other places

CD is less common than other places

Very few Maori / Pacific Island people have IBD

Introduction

the reality in Christchurch

- clinics full of IBD patients
- most clinically difficult group of patients
- ↑ use of expensive tests/therapies
- CD >> UC
- little understanding of aetiology

How common is IBD in Canterbury?

- Try to find every person living in Canterbury ever diagnosed with IBD

= Prevalence

- Try to find every person living in Canterbury diagnosed with IBD in 2004

= Incidence

Ulcerative colitis

$p = ns$

How common is IBD in Canterbury?

- In 2004, Canterbury had the highest rate of newly diagnosed CD ever recorded
- There is more CD than UC in Canterbury
- Women are more likely than men to get CD
- People are often diagnosed when young
- IBD - uncommon in Maori / rare in Pacific Islanders
- More medical services will be needed to treat people with IBD

IBD in New Zealand

a new epidemic?

ep-i-dem-ic (p -d m k) or **ep-i-dem-i-cal** (- -k l)
adj.

- Spreading rapidly and extensively by infection and affecting many individuals in an area or a population at the same time, as of a disease or illness.

n.

- An outbreak or unusually high occurrence of a disease or illness in a population or area.

What causes IBD?

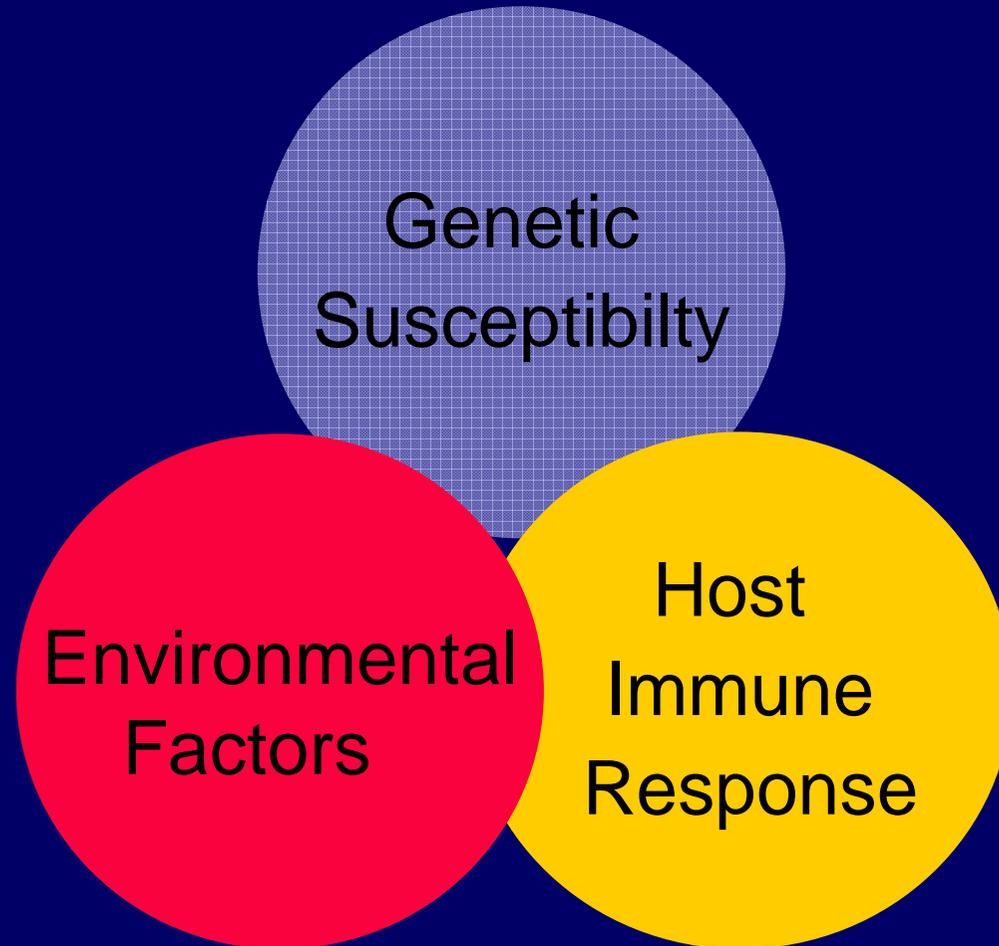

Insights from your backyard

What causes IBD?

Insights from your backyard

- Genes
- The “coal face”
- The environment – the forgotten factor

Current concepts of IBD

IBD and Genes

Genes

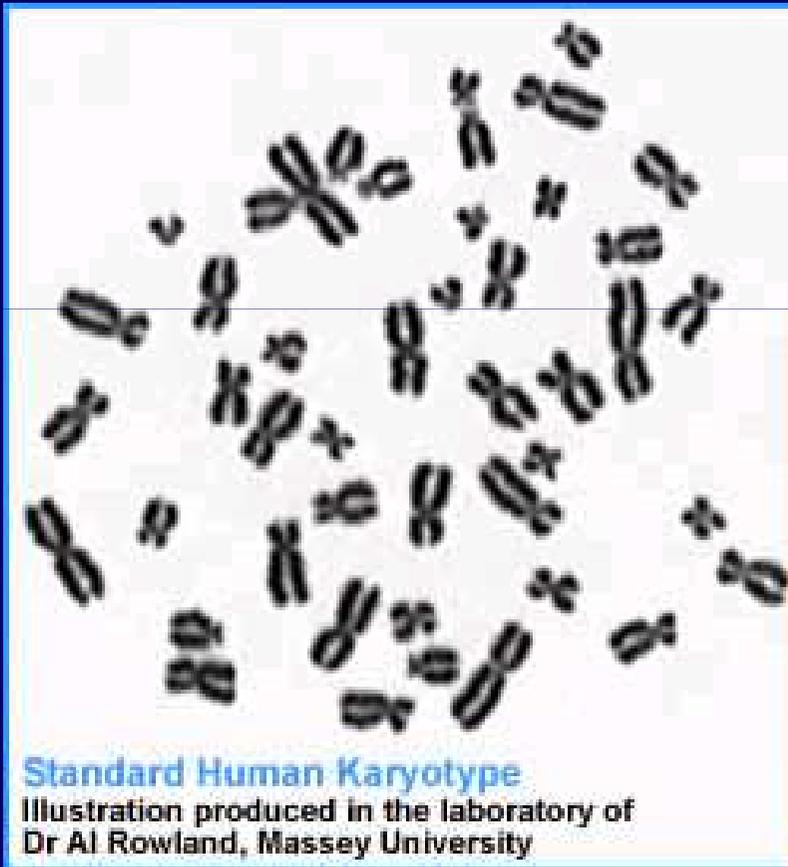

If you have IBD, you are 5-10x more likely than someone without IBD to have an affected first degree relative

Are

If you are an identical twin with Crohn's disease, you will have a 70% chance of having Crohn's disease as well

Important

How much genetic information does each of us contain?

- 60,000 genes in the human genome
- 2 metres of DNA in every cell
- many aspects of bodily function require multiple genes

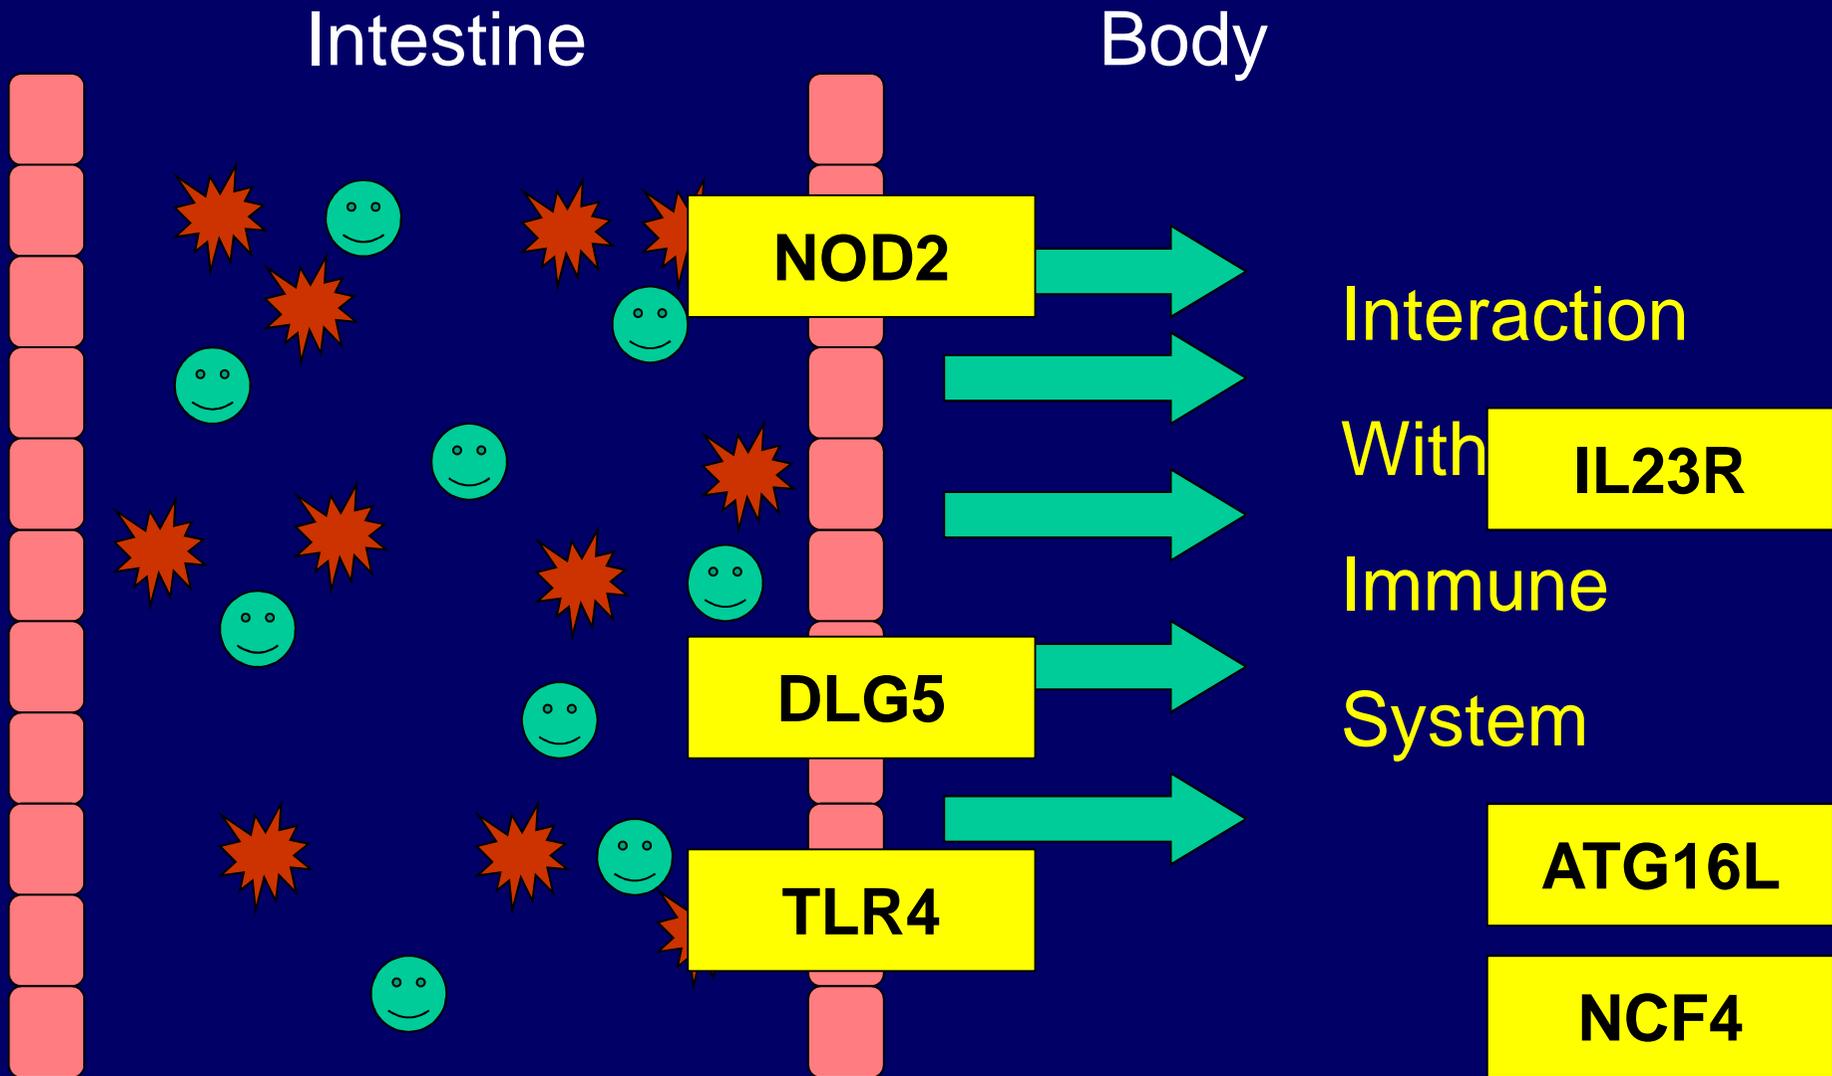

So what are genes?

- Our individual blueprint
- The instructions needed to make proteins
 - Building blocks
 - Enzymes
 - Receptors
 - Cytokines
 -

IBD and Bacteria

- Immune system identifies and eliminates foreign organisms and particles
- We are 1% human, 99% bacterial!
- Symbiotic relationship (immune tolerance)
- Dysregulation exacerbates inflammation

IBD Pathogenesis

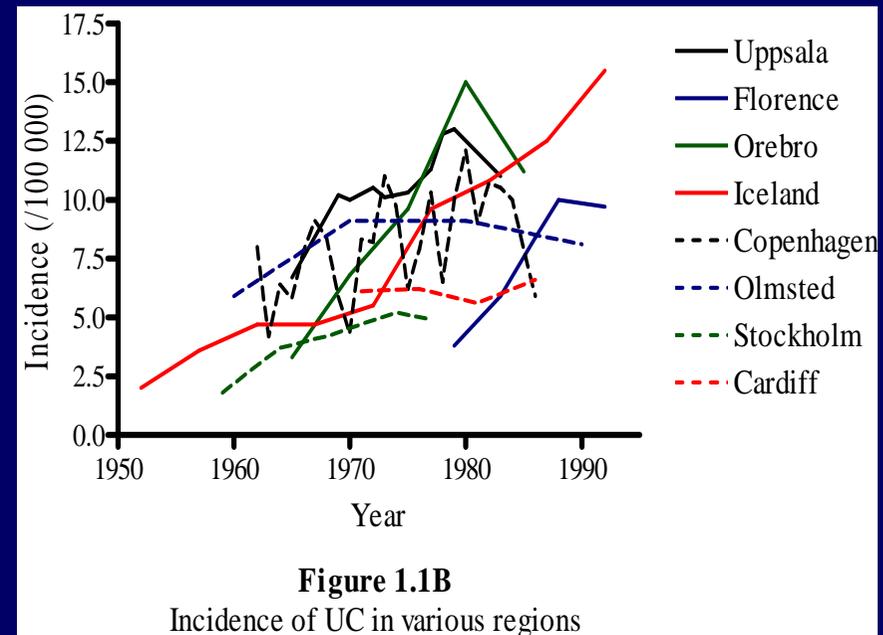

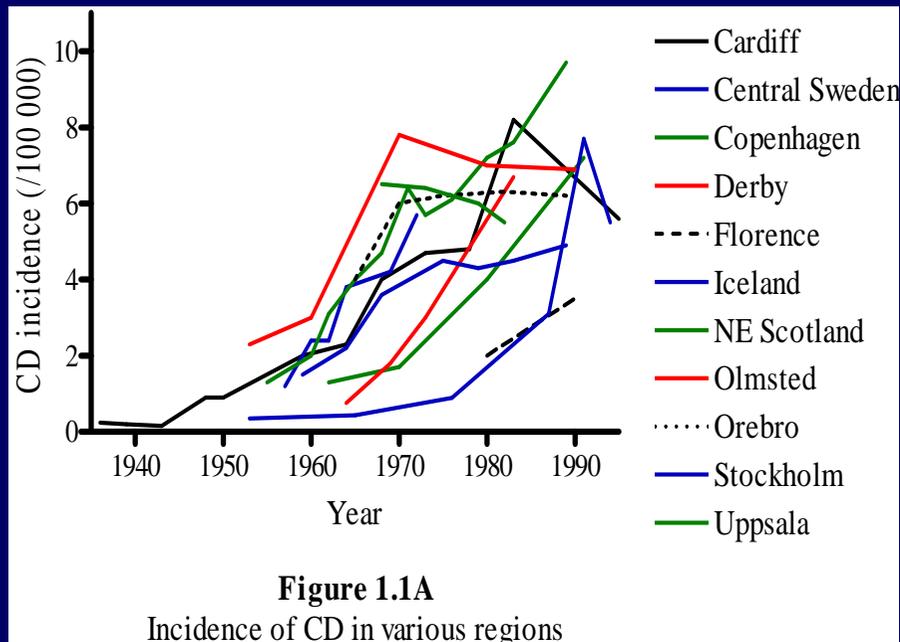

NOD2 mutations occur more frequently in some types of CD...

- Stricture (narrowing) 2x ↑
- Ileal disease location 3x ↑
- Bowel resection surgery 4x ↑
- Relative with IBD 1.5x ↑
- Diagnosed <17 years 2x ↑

Introduction

IBD epidemiology

The incidence of IBD has risen rapidly over the last 50 years

The environment and IBD

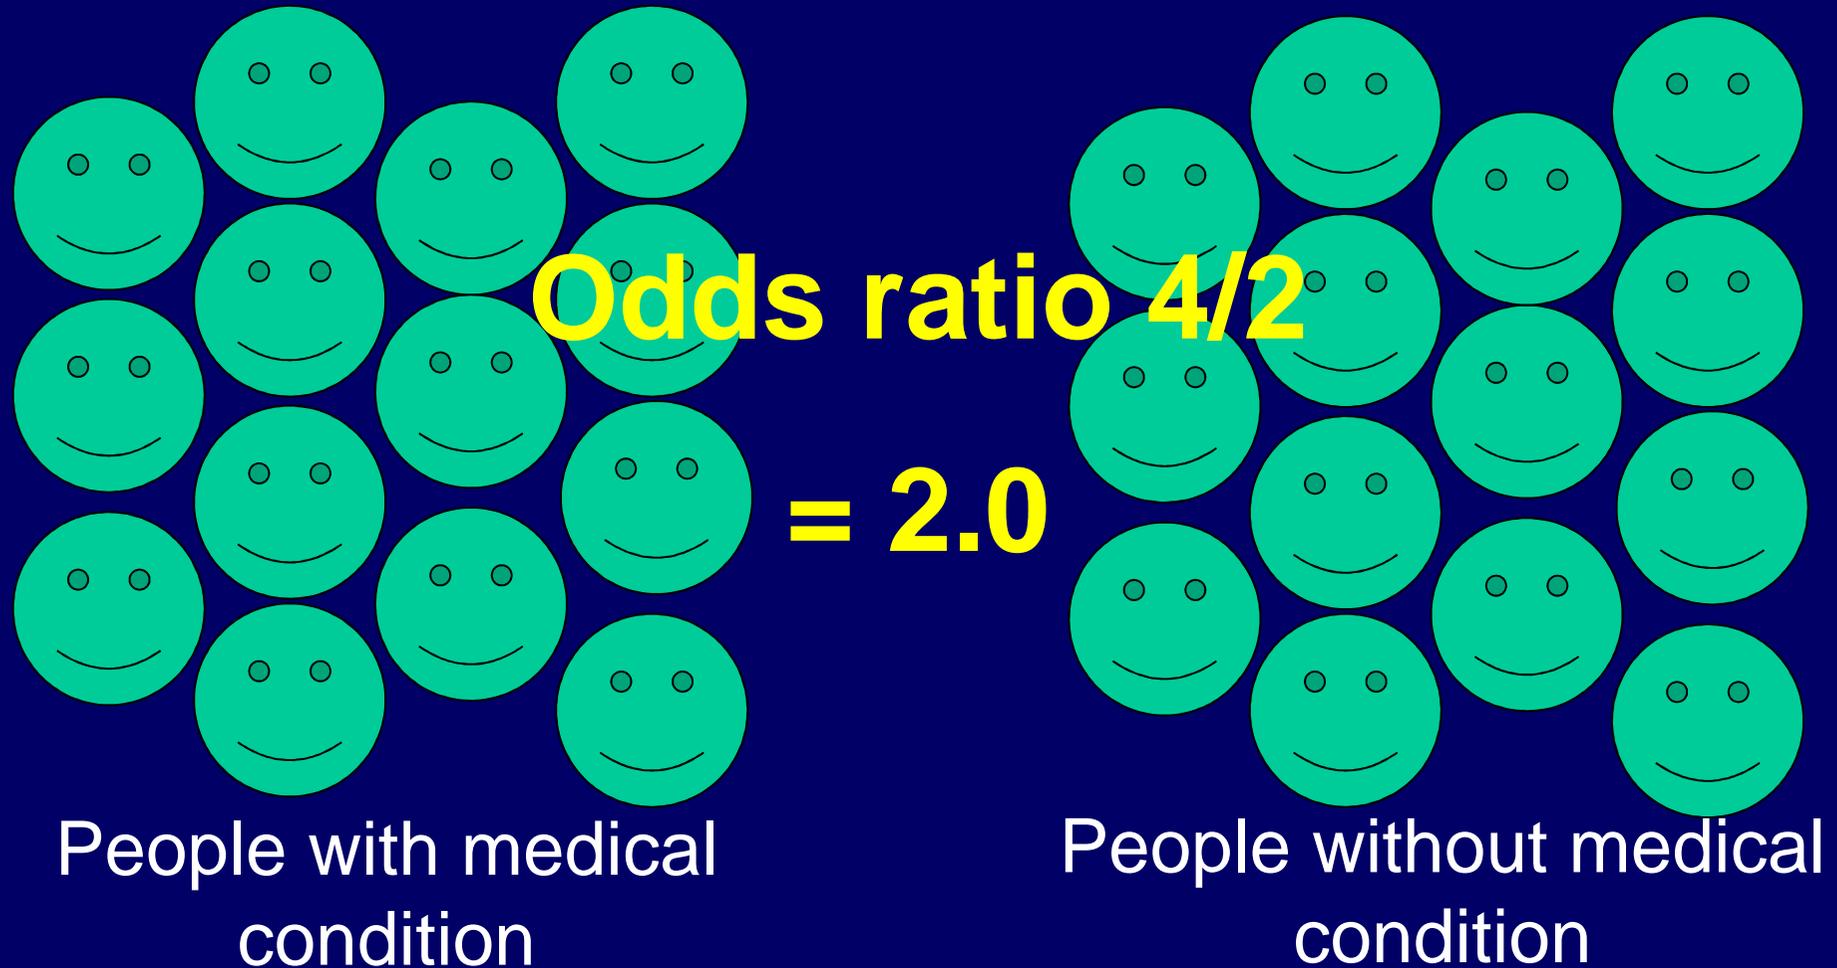

- Genes cannot explain the rapid increase in IBD
- Rapid changes in disease incidence

=

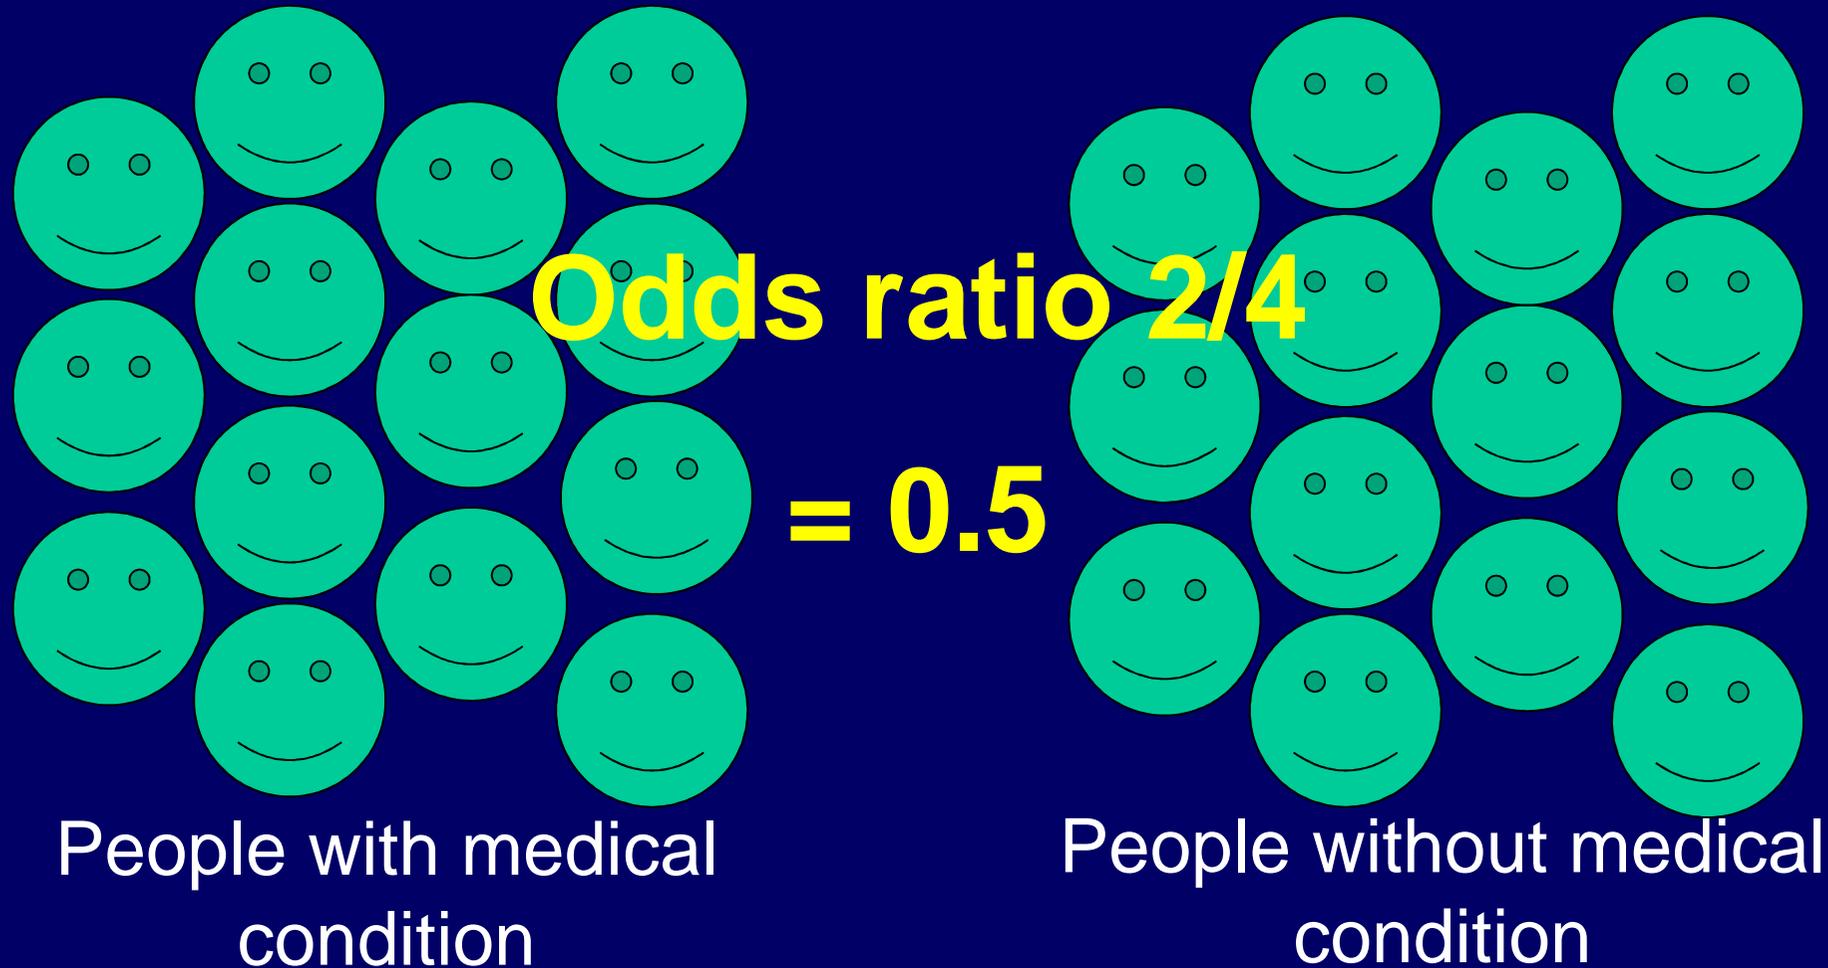

Changes in environmental factors

“Genes may load the gun, but the environment pulls the trigger”

| Childhood vege garden | 0.6 | 0.4-0.9 |
| Childhood SES | 1.7 | 1.2-2.4 |

Do environmental factors play an important role in IBD?

- Environmental factors are very important
- Some environmental factors may be modifiable
- Associations give us clues as to why IBD occurs
- Many risk factors may occur in infancy / childhood

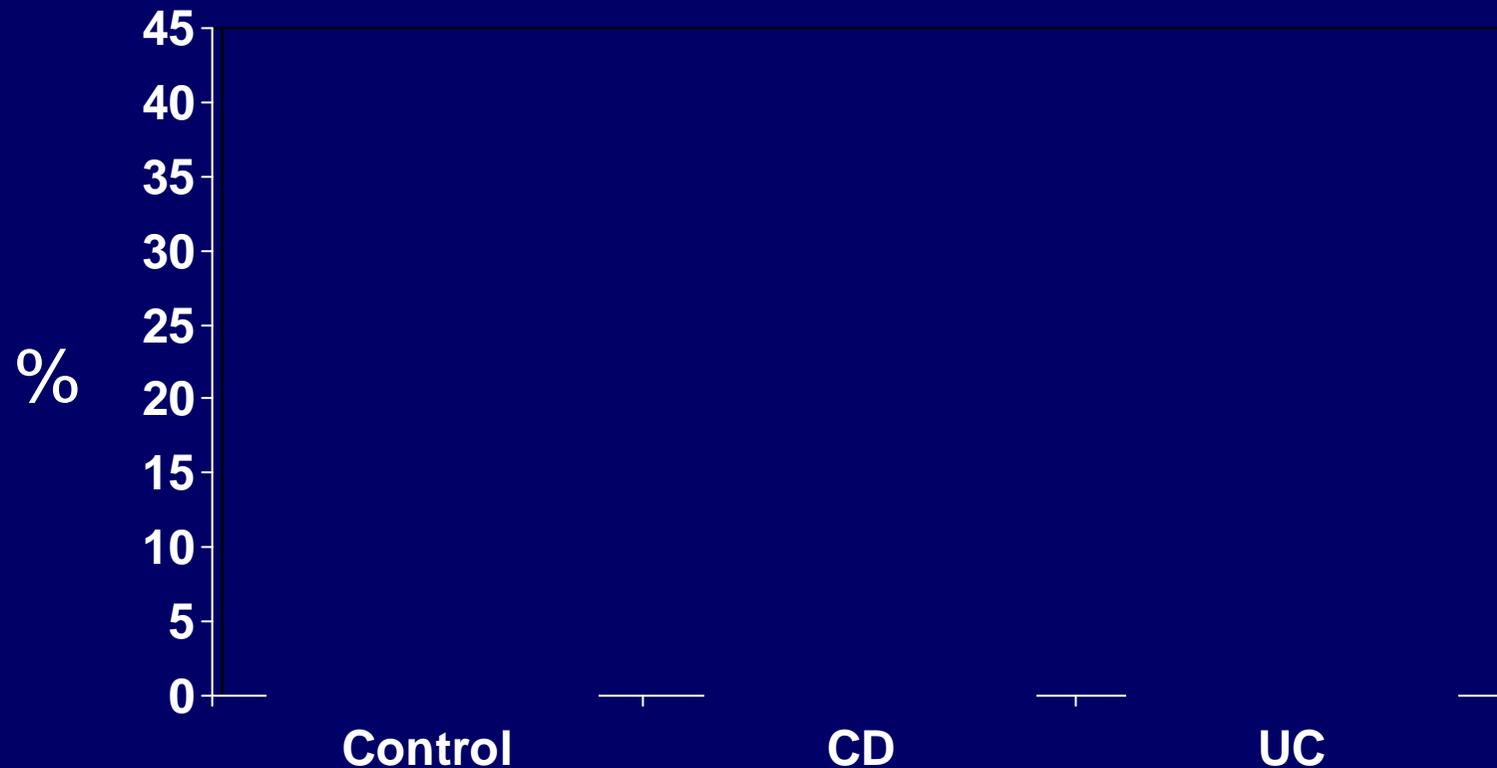

Causes of IBD are Multifactorial

The effect of IBD

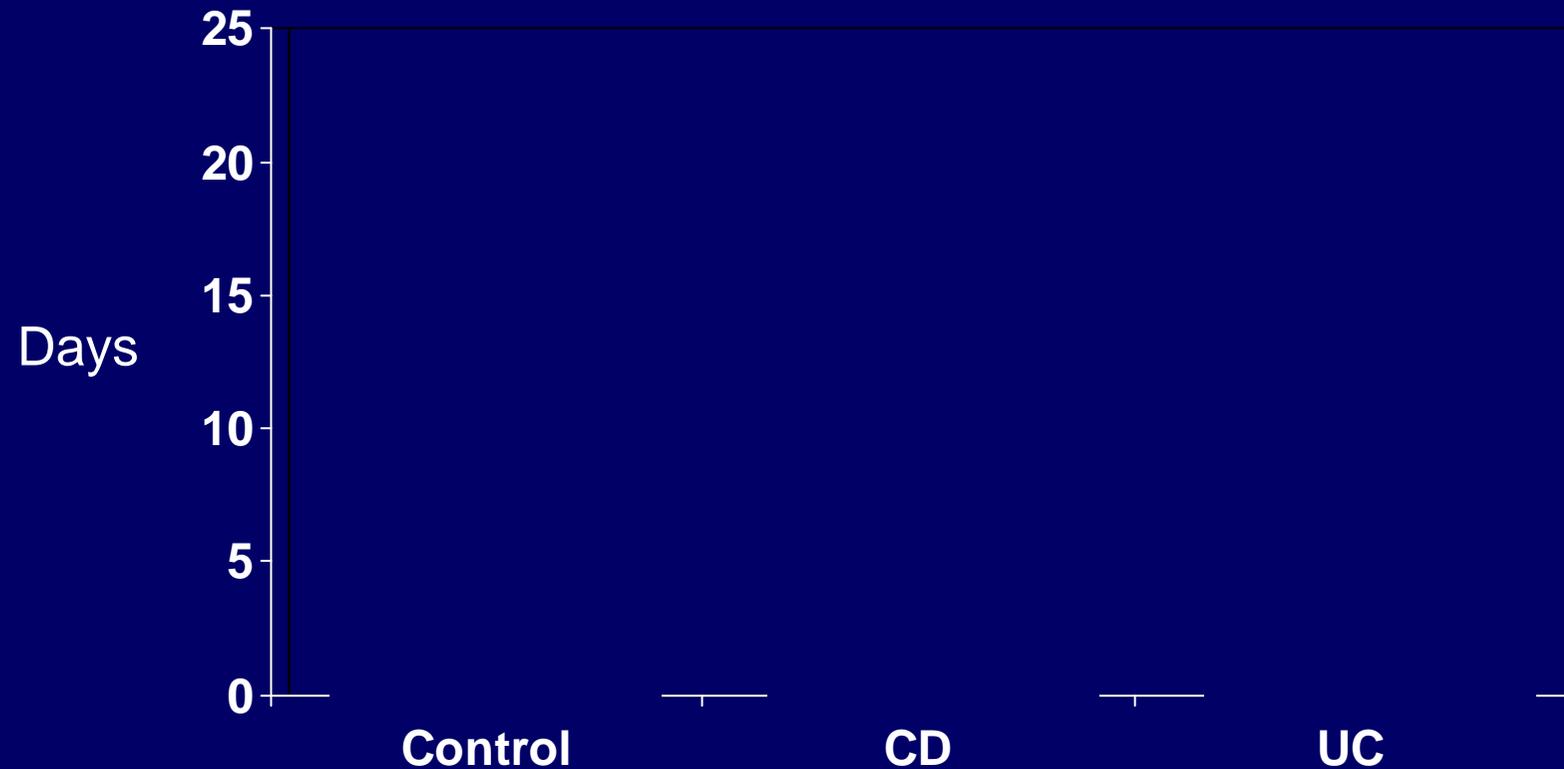

- Important to measure the effects of disease
 - Resource allocation
 - New treatments
 - Medical /nursing staff
 - Community support
 - Prognostic information for patients

The effects of IBD (1)

Does a health problem or condition you have (>6 months) cause you difficulty with or stop doing everyday activities that people your age can usually do?

Average number of days away from usual activities

The Canterbury IBD Study

Conclusions

- IBD is not rare in Canterbury; CD is very common
- IBD in Canterbury is similar to elsewhere
- Genes are important – but not the whole story
- Environment is important – but difficult to unravel
- IBD has a significant impact on the lives of many Cantabrians
- The Canterbury IBD Study provides a unique tool for ongoing population-based research

Drug Treatment of IBD

the battle to get and keep you well

Overview

Lifestyle

Medical Treatment for IBD

Disease flare

Medical Treatment for IBD

Maintenance of remission

No role for long term steroids in maintaining remission in IBD

~~Biologicals~~

~~Immunomodulators
(Azathioprine, 6 MP, Methotrexate)~~

5-ASAs
(Sulfasalazine, Pentasa, Asacol)

Medical treatment for severe IBD (requiring admission to hospital)

Intravenous steroids (5-7 days given 6 or 8 hourly)

Biological Agents (Remicade / Humira)

Only for UC - IV Cyclosporin (rarely)

Only for CD Exclusive Enteral Nutrition (paediatrics)

Surgical Opinion

Medical therapy for IBD

| Treatment | UC | | CD | |
|-------------------|---------|-----------|---------|-----------|
| | relapse | remission | relapse | remission |
| 5-ASA/SSZ | + | + | ± | ± |
| Steroid | + | - | + | - |
| Aza/6MP/MTX | ± | + | ± | + |
| Biological Agents | + | + | + | + |
| Antibiotics | - | - | ± | ± |

Biological Therapies

what are they?

- Designer drugs
- Aimed at specific molecules in the inflammatory cascade
- Also known as “MABs” – Monoclonal AntiBodies
- New drug - ?long term safety...
- At least as effective as anything we have now
- Fewer obvious side effects
- Very expensive ...

Remicade (infliximab)

- Monoclonal antibody to TNF- α
 - Central cytokine in the inflammatory / immune response
- Given Weeks 0, 2, 8 then 8 weekly
- 97% human sequence / 3% mouse sequence
- Given as a 2-3 hour infusion
- Rapid onset of action
- Infection / ? Lymphoma / Allergy

- www.remicade.com

Remicade for Perianal Disease

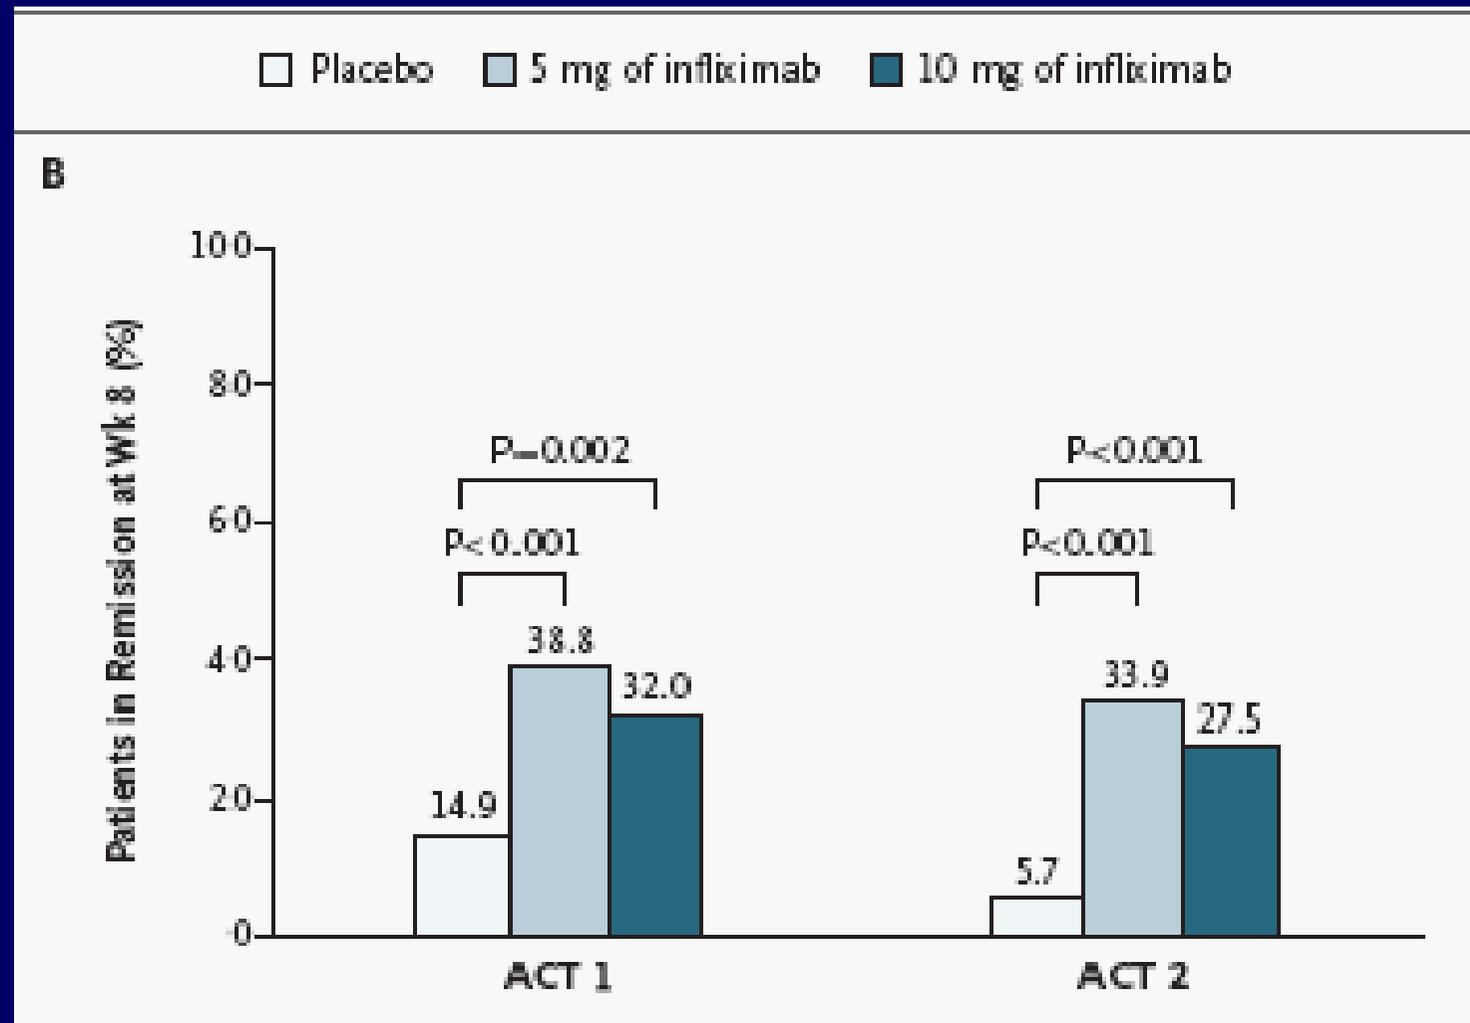

- 68% v 26% had >50% of fistulas closed
- 55% v 13% had all fistulas close
- Well-tolerated

- But if you stop taking it – they come back!!

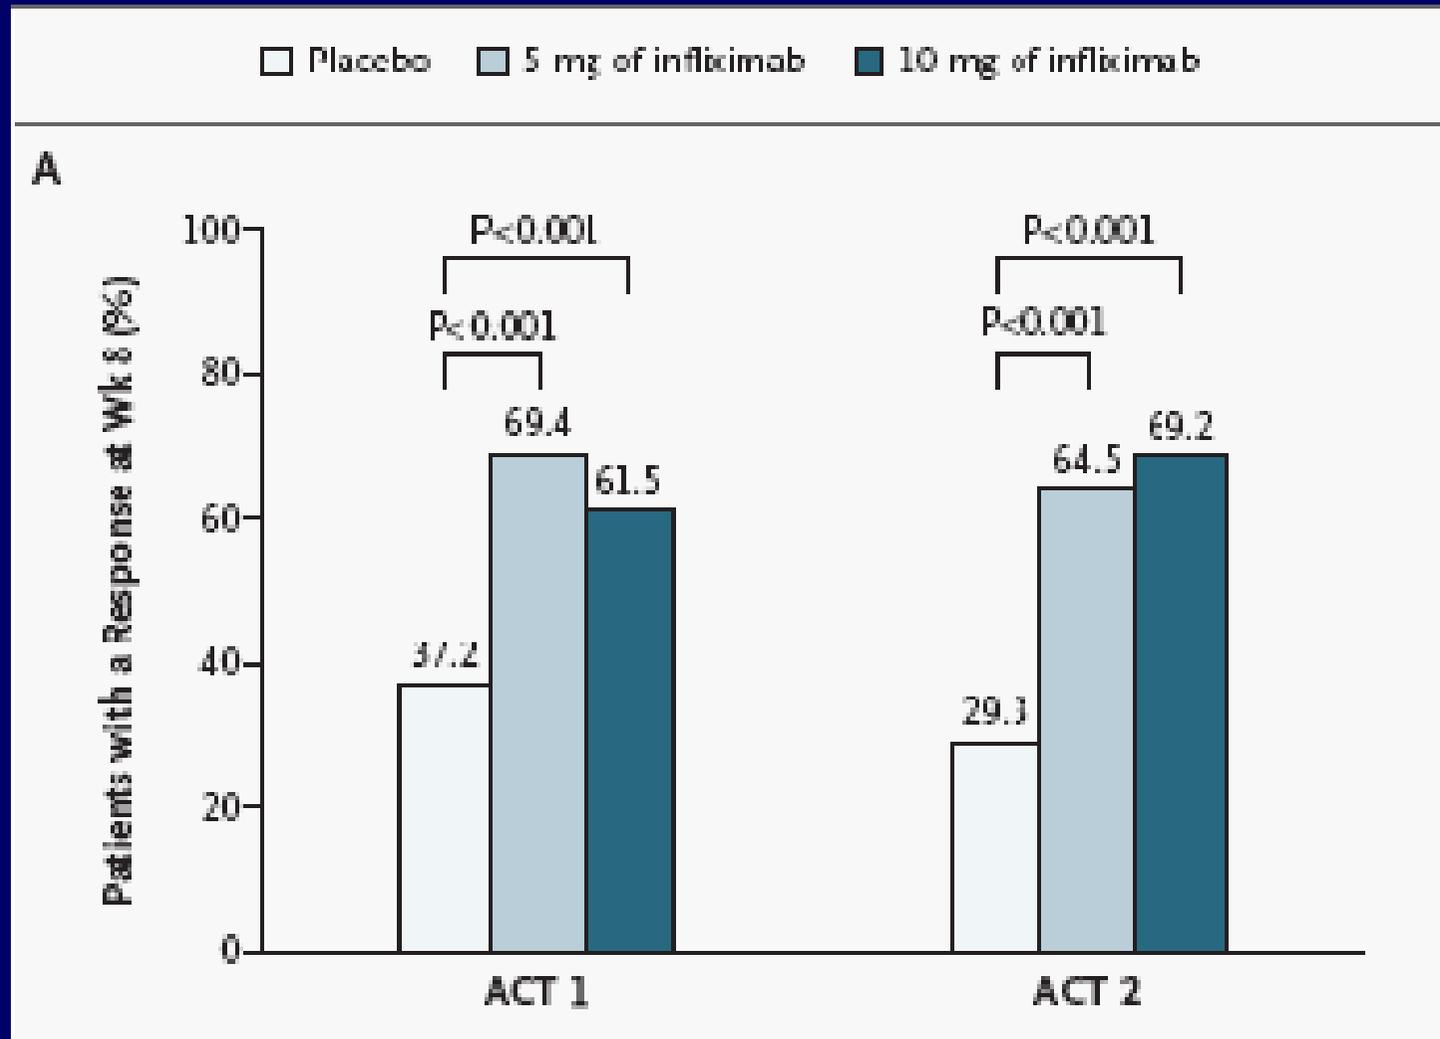

Remicade for Luminal CD

- Remission at 4 weeks
 - 33% v 4%
- Improvement at 4 weeks
 - 81% v 17%
- Maintenance of remission (1 year)
 - 39% v 21%

Remicade for UC

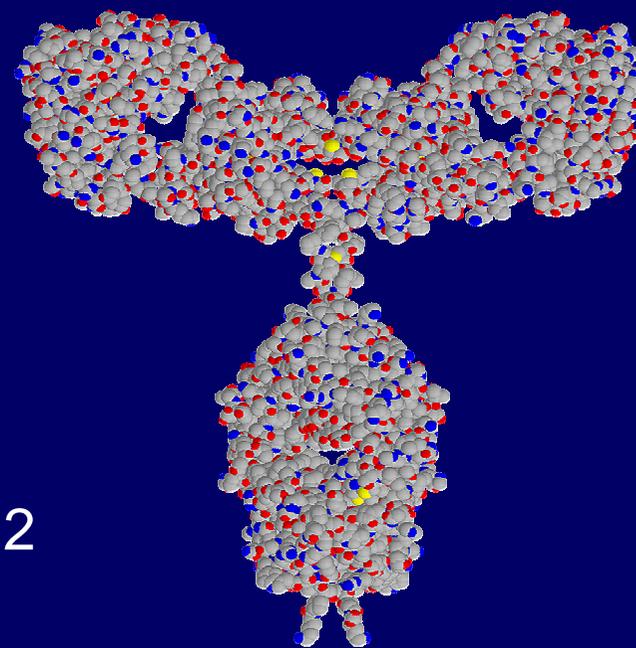

Remicade for UC

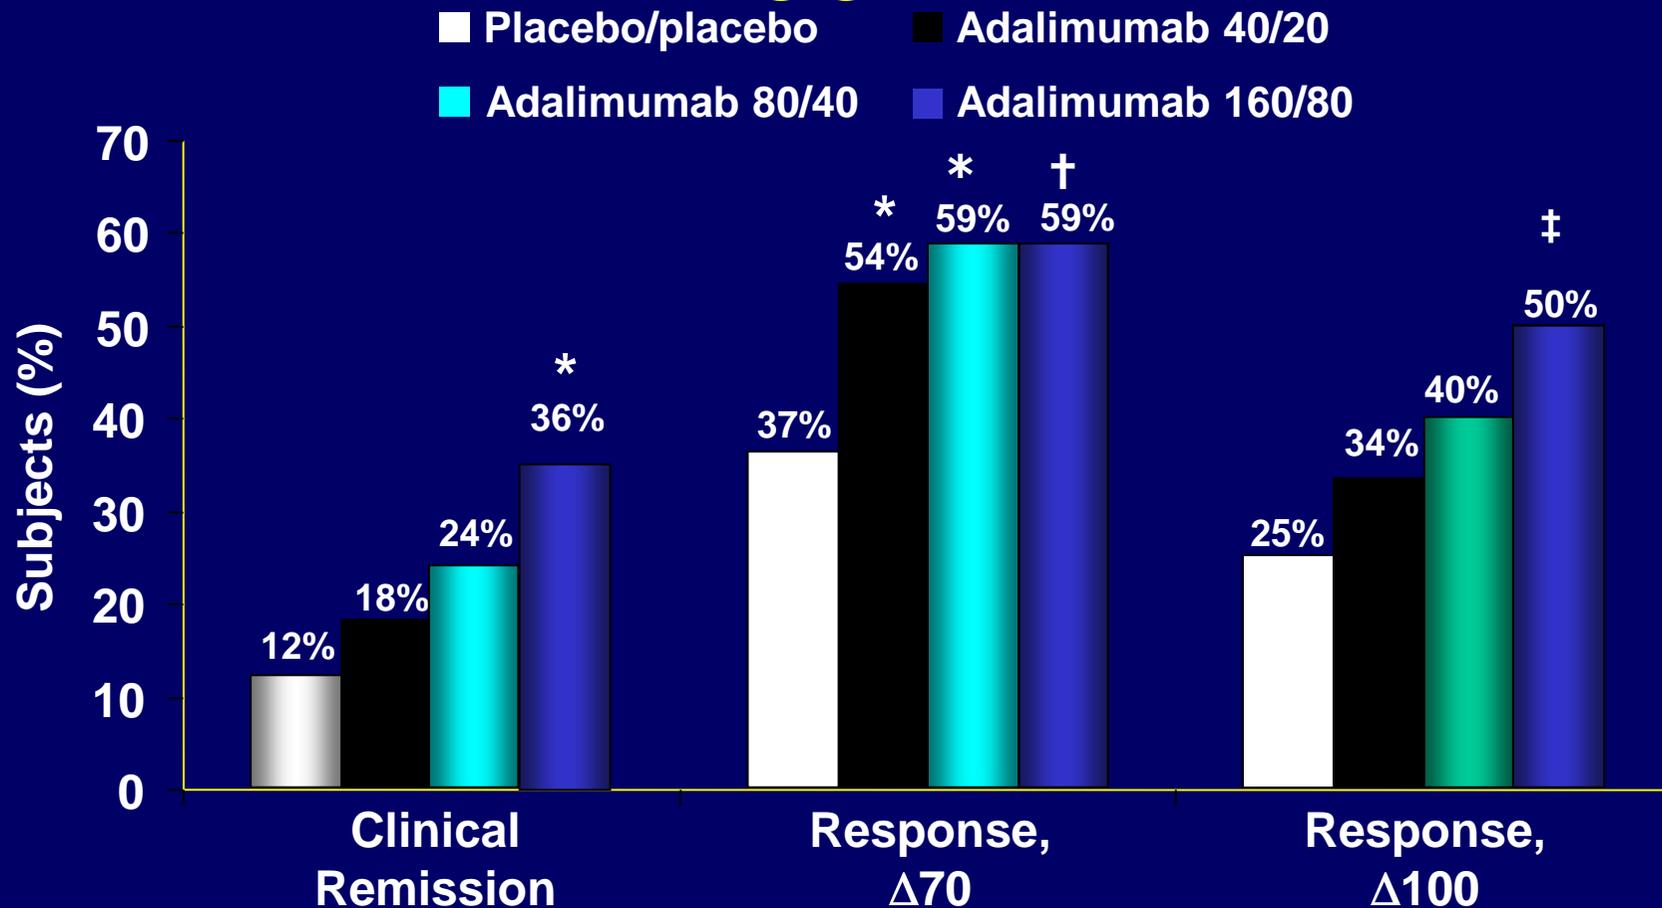

HUMIRA (Adalimumab)

- Fully human monoclonal antibody (IgG₁)
 - specifically neutralizes TNF- α
- Self-administered sub cut injection
- RA / PsA / AS dose
 - 40 mg every other week (eow)
- Crohn's Disease:
 - Induction 160mg week 0 / 80mg week 2
 - Maintenance 40 mg eow
- >180,000 patients currently being treated worldwide

CLASSIC I Trial: Results at Week 4

• $p < 0.05$; † $p = 0.003$; ‡ $p = 0.002$

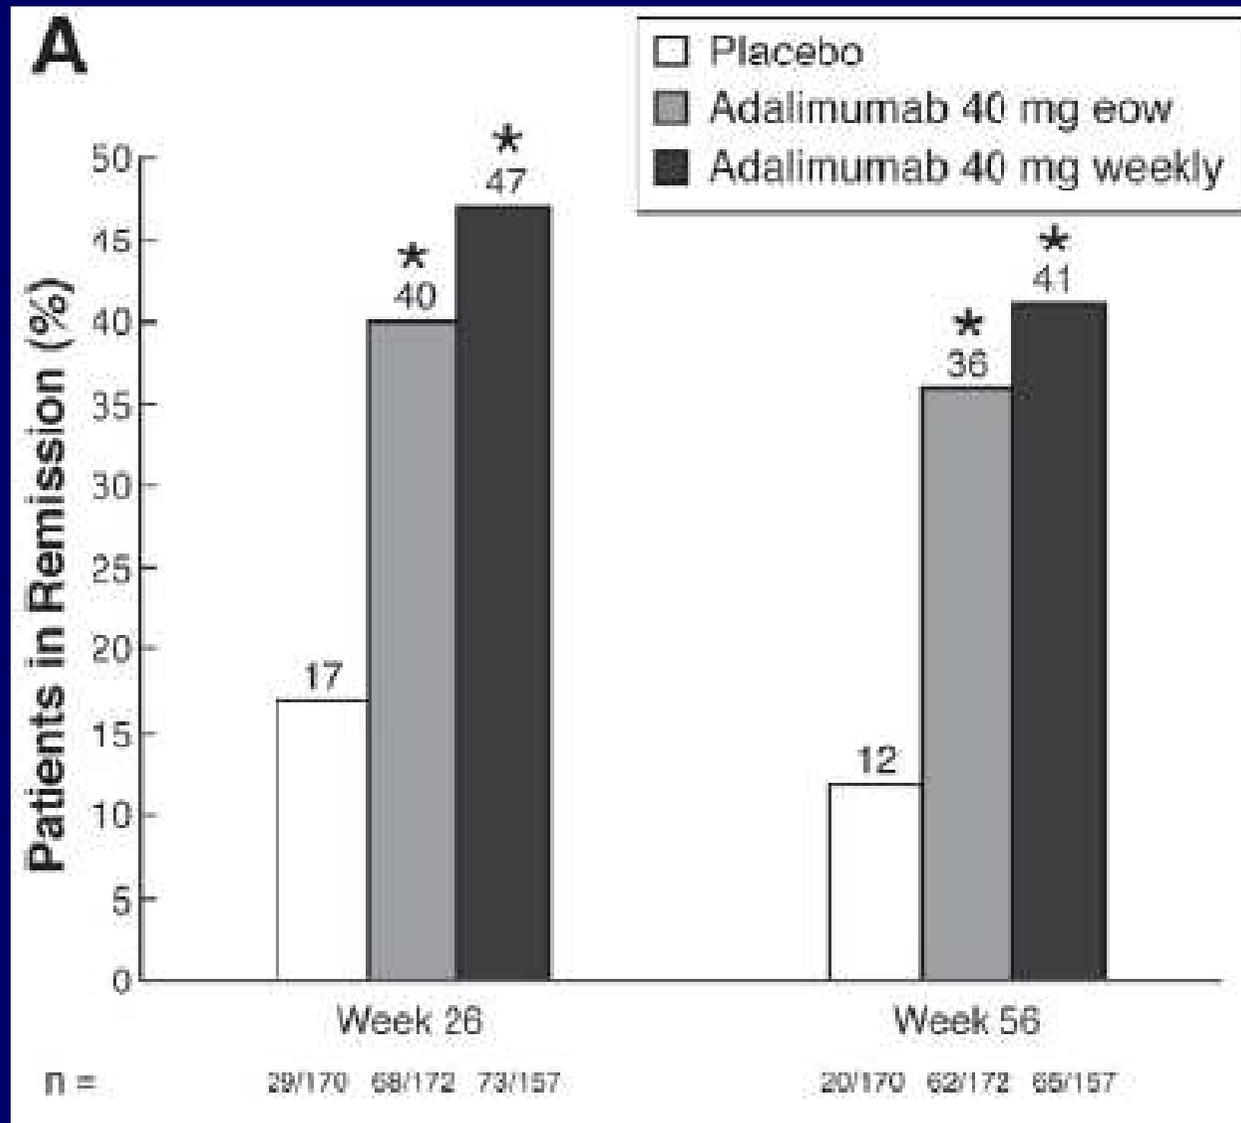

Clinical remission = CDAI < 150

Clinical response $\Delta 70$ or $\Delta 100$ = CDAI decrease from baseline ≥ 70 or ≥ 100

CLASSIC I: Treatment-Emergent Serious Adverse Events Summary

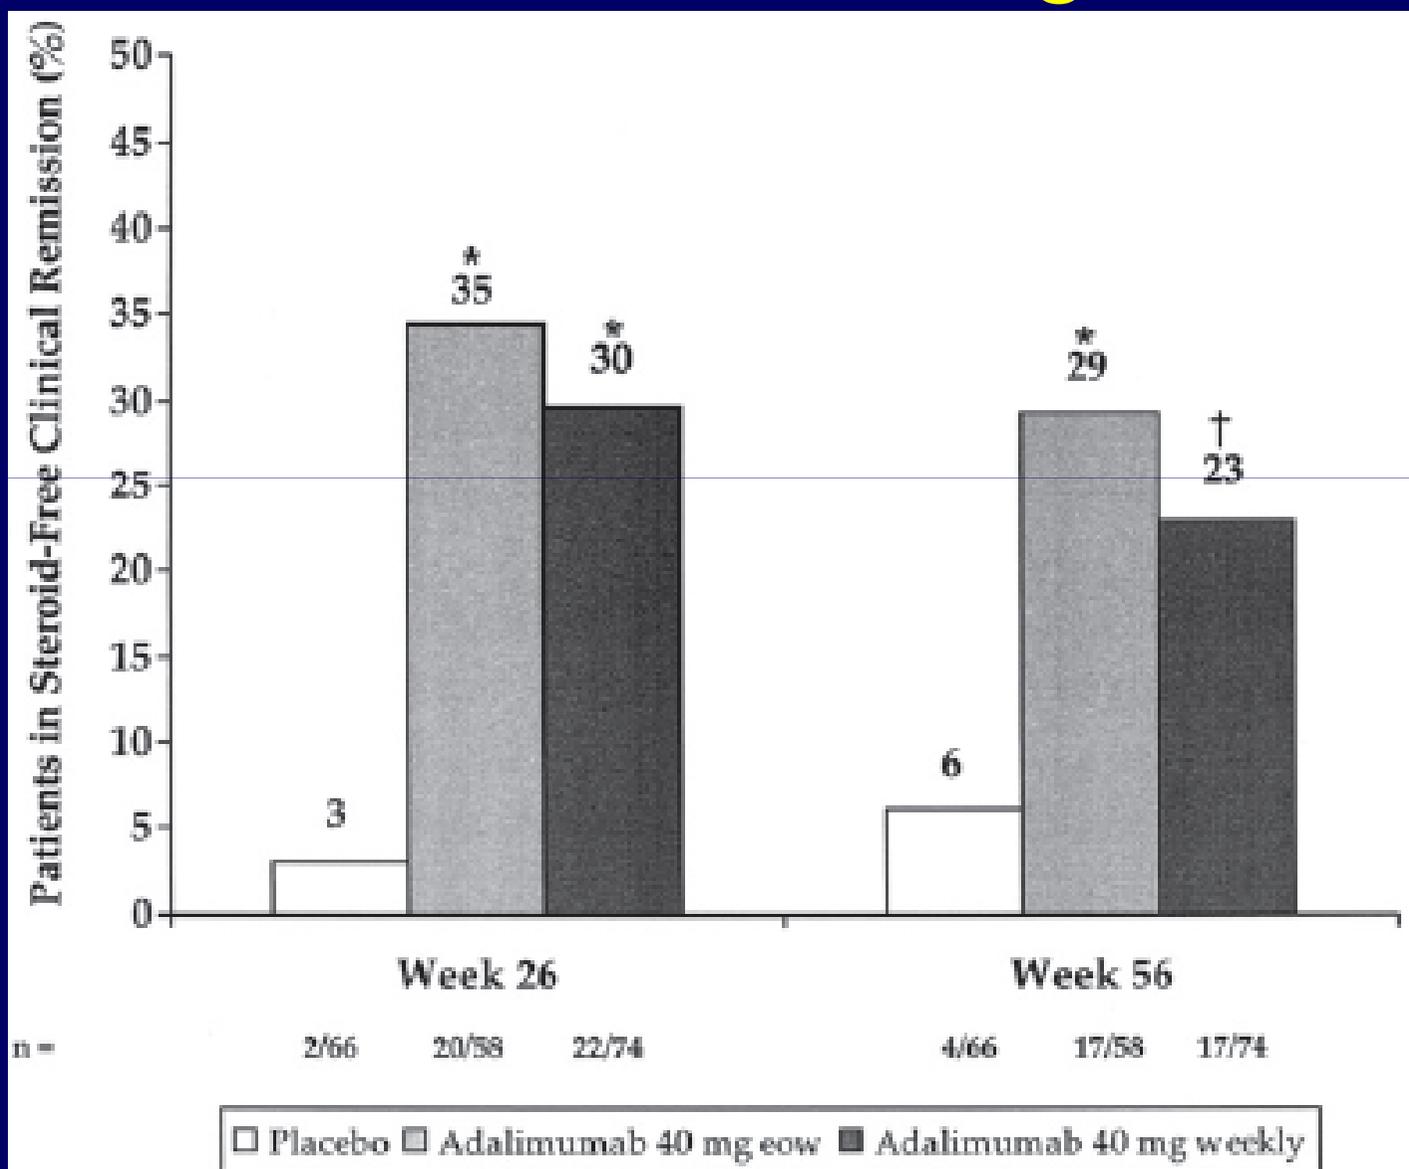

| | Placebo n=74 | 40/20 mg EOW n=74 | 80/40 mg EOW n=75 | 160/80 mg EOW n=76 |

Colombel JF, et al. T686d, DDW 2006; data on file.

GAIN: Efficacy Outcomes at Week 4

*P<0.001, †P<0.01, both vs. placebo.

Outside the square

- Children
 - Remicade
 - Used effectively
 - Safety data
 - Clinical trial data
- Pregnancy
 - Remicade
 - Contraindicated
 - Pregnancy may occur on the drug
- Breastfeeding
 - Remicade
 - Not advised

Costs and Implications

- These drugs only work if you keep taking them
 - Need to have a viable alternative option in the future (eg azathioprine or methotrexate)
 - No other alternative available (including surgery)
- Long term safety data are lacking

Costs and Implications

- Remicade cost \$1175/ 100mg vial
 - 5mg/kg is the standard dose
 - 5 X 60kg = 300mg (\$3525/dose)
 - 3 X induction doses then 8 weekly = \$31725 per year
 - 3 X induction doses only = \$10575
- Humira cost \$900/ 40mg injection
 - 160mg / 80mg / 40mg eow
 - 3 X induction doses then 40mg fortnightly = \$27000 per year
 - 3 X induction doses only = \$6300

Costs and Implications

- Current use at Christchurch Hospital
- Remicade
 - July-Sept 2005 \$70500
 - July-Sept 2006 \$185395
 - July-Sept 2007 ...
- No Humira data as yet

Implications

Canterbury IBD incidence (2004)

Inflammatory bowel disease

25.2 / 100 000

Crohn's disease

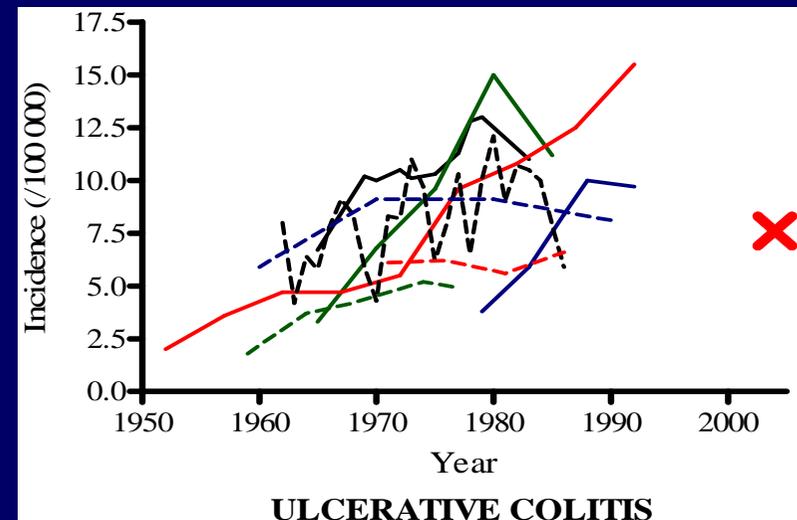

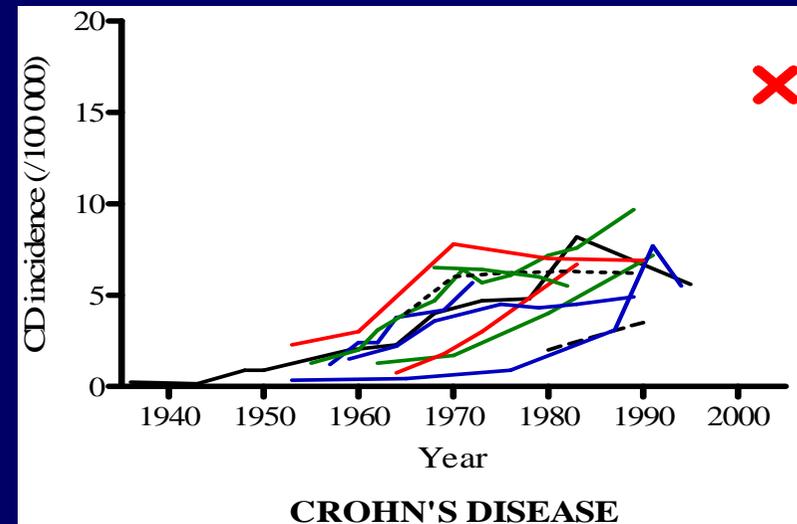

16.5 / 100 000

Ulcerative colitis

7.6 / 100 000

Indeterminate colitis

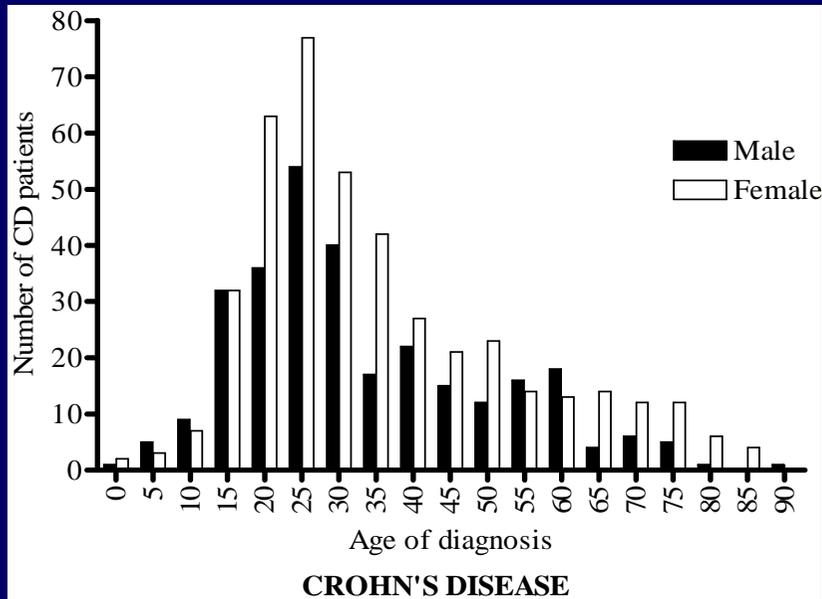

1.1 / 100 000

Gearry et al, Inflammatory Bowel Diseases, 2006

Implications

Sex and age of onset

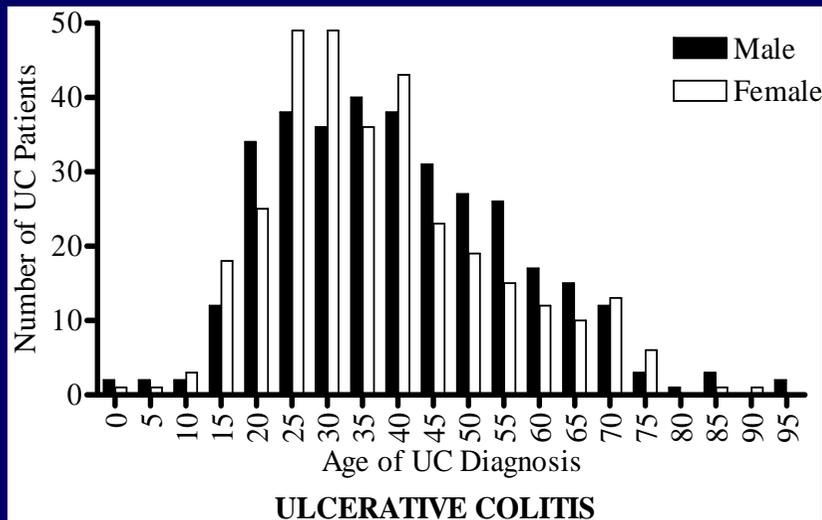

Crohn's Disease

Female > Male ($p=0.042$)

Peak age onset ~25 years

Second peak ~55 years

Median age onset 29.5 years

Ulcerative colitis

Male > Female (ns)

Peak age onset ~30 years

Median age onset ~36.5 years

Future directions

- New Mabs mean competition
- Competition lowers price
- Lobbying Pharmac / Politicians
- NZSG / Gastroenterologists / Patients
- Signalling high cost to hospital managers

Key Messages

- Mabs are not magic bullets
- Long term safety data is lacking
- Effective alternative in specific situations
- Costs are high
- National disparity in access
- Pressure on Pharmac and Politicians
- Joint approach is advocated

ACCA IBD Document

- Economic cost of IBD = **\$2.7 billion** (includes a financial cost of **\$500 million** + net cost of lost wellbeing **\$2.2 billion**)
- Lost productivity accounts for > half cost (\$266.7 million)
- Estimated cost of absenteeism for IBD patients = \$52.3 million
- Costs to the health system = \$79 million
- 939,000 hours of informal care provided to IBD patients (\$23.5 million)
- Estimated out of pocket expenses for IBD patients = \$35.8 million

IBD Drug Treatment Summary

- UC – 5ASA is the best option
- CD – less evidence for 5-ASA
- CD – immunomodulators key for maintenance
- Steroids – no long term role
- Biologicals – the missing link
